I was just getting ready to send additional information. I built a new Pi for a friend before and you need to install additional nodes and a dashboard before importing my flows. I recommend to delete any flows that were imported first.

Click on the three horizontal lines in the upper right corner and choose Manage Palette. When that window opens choose Install.

In the search modules window search and install the following

node-red-contrib-msg-resend
node-red-contrib-ui-led
node-red-contrib-ui-level
node-red-dashboard
node-red-node-wol

After those are installed you can import my flows.

On the right side click on the dashboard icon (see attached picture) and you will see a bunch of tabs labeled WO2X Shack Control. Expand them by clicking on the v arrow in front of them. You will then see the groups (KPA1500, ROTOR, etc). You can drag all the groups to one tab so they all show up on the dashboard page together. To delete the unused tabs afterwards just click on edit to the right of the tab name and in the window that opens choose Delete.
